rivaALVA EXPLORER OVERLAND

1. The rivaALVA Explorer OVERLAND is supplied in 2 individual housings incl. hose connections and adapter (according to scope of delivery).
2. rivaALVA Life and riva MULTI filter cartridges are pre-installed in the housings (see sticker on the housings).
3. When installing the filters, first connect the rivaALVA Life and rinse briefly (approx. 5 seconds) so that residual dust from the activated carbon does not clog the MULTI.
4. Afterwards, please simply screw the housings tightly together (same direction of arrow).
5. When using the double system, please note that the block activated carbon filter rivaALVA Life is always the first filter from the water input source. The riva MULTI hollow fibre membrane filter follows as the ultra-fine filter (2nd filter stage).
6. The block activated carbon filter with 20 µ filter fineness is able to remove possible impurities from the water to intercept the movements. The hollow fibre membrane filter with 0.2 µ is very sensitive to dirt and can clog faster, so please always use the MULTI as the 2nd filter stage.
7. **Important!** Connect the water input source in the direction of the arrow and **always install and use filter cartridges and filter housing in the direction of the arrow.**
8. This filter system can be use with outdoor water sources (rivers / lakes). You need a water pump (12 V, minimum pressure 1 bar). Please use for the water suction hose (at water supply source) a commercial pump pre-filter in order to pre-filter coarse impurities (sand / sediments).
9. For travelling we recommend the purchase of additional hose adapters (plugs) in different inch sizes (at the DIY store), so that you have the possibility to connect the filter system to any hose diameter on the road.
